

Presentation Script — SmartLife & Budget Balance Platform

English for Business Presentations · Week 9 Video Pitch

Target length: under 7 minutes (~670 words, 5 parts, simple wording, no Q&A — Week 9 video submission)

Part 1: Opening & Introduction

~1.1–1.3 min

Content covers:

Greeting, self-introduction, project name, and why the topic matters.

Your Script:

“Good morning everyone. Thank you for being here today. My name is Narongchai Thathong, and this project is made with my teammates, Konpong Chaovanakittikun and Natkamol Petcharat. Today I would like to present our project, ‘SmartLife & Budget Balance Platform’, or SmartLife for short. SmartLife helps university students manage their daily schedule and their money, all in one app. This matters because right now, we have to use many separate apps just to get through a normal day — one for our class schedule, one for taking notes, and another just to track how much money we have left. Switching between all of these apps wastes our time and energy — time that should go into studying instead.”

Part 2: Structure & Housekeeping

~1–1.1 min

Content covers:

Presentation outline and time limit.

Your Script:

“I have divided my presentation into three parts. First, I will talk about the problems students face with their time and money. Next, I will show you the core features of SmartLife and how they solve these problems. Finally, I will summarize the benefits and close. This presentation takes under seven minutes, and it shows you a real, working product — not slides describing an idea, but an app you can open and use today. Everything I show you is captured directly from our real app, built with Expo, React Native, and a live Firebase database — not a mockup, and not a design concept.”

Part 3: Main Point 1 — Current Problems

~1.2–1.4 min

Content covers:

Introducing the pain point: too many separate apps, wasted time, burnout risk, and giving up on budgeting.

Your Script:

“Let's start with the problem. As students, we deal with class schedules, deadlines, exams, activities, and a limited budget, all at the same time. With no single tool for all of this, we end up using several different apps: one for our schedule, one for notes, and one for expenses. Moving between them wastes about fifteen minutes a day — around sixty hours a semester, time we could spend studying or resting instead. On top of that, normal schedule planning does not check how tired or stressed we are, so many students risk burnout without even noticing it. And logging every expense by hand takes so much effort that most of us simply stop budgeting after a few weeks. SmartLife was built to solve all of these problems, in one single app.”

Part 4: Main Point 2 — Core Features

~1.3–1.5 min

Content covers:

A quick walkthrough of the four core features and how each one solves the problem above.

Your Script:

“Now for the solution. SmartLife has four core features. First, the Unified Dashboard shows your schedule, your budget, and an AI assistant on one screen. You can simply ask it a question — like how many classes you have today — and it answers instantly using your real data. Second, the Smart Schedule Importer lets you take a photo of your class timetable, and it automatically reads it and adds everything to your calendar. Third, the Smart Schedule Builder learns from your habits, suggests better study times, and gives you a short check-in if your study-rest balance looks off. Finally, the Personal Finance Tracker lets you scan a receipt, and it automatically sorts the expense into the right category, like food or transport, and warns you when you go over budget. Together, these four features work as one connected system, not four separate tools.”

Part 5: Main Point 3 — Benefits & Conclusion

~1.5–1.7 min

Content covers:

The third promised part: summarizing the benefits, restating why the project matters, and closing.

Your Script:

“Well, this brings me to the end of my presentation. To sum up, SmartLife takes the problem of juggling many apps for schedule and money, and replaces it with one smart, simple platform. It saves students time, gives a clear view of daily life on one screen, supports better mental wellbeing, and builds healthier habits for both time and money. Every screen I've shown you today is from our real, working app, running on real data — this is not just an idea or a design mockup. We built this for students at Suranaree University of Technology, using the skills we learned in this program, to solve a problem we face ourselves, every single day. Going forward, we want to keep improving SmartLife with real feedback from students who actually use it, because our goal was never just to finish a class project — it was to build something we would truly want to keep using on our own phones. Thank you very much for your time and attention.”

Delivery note: this version (about 670 words) is sized for your own measured full read-through — the previous version (about 770 words) took you 7 minutes 30 seconds start to finish, which works out to roughly 103 words per minute once pauses between parts and slide switches are included. At that same pace, this shorter version runs about 6.5 minutes, leaving a real buffer before the 7-minute limit. Still no Q&A section, and still simple, everyday words. Time yourself once more start to finish — if you are still running long, trim Part 5 first; if you finish early, use the extra time to slow down and speak with confidence instead of rushing.
